

From AI-built to a credible championship entry

A 76-item verification checklist, evidence review and plan for what matters next.

The interface and local workflow are strong enough to demonstrate. The next competitive gains should come from operator evidence, measured reliability, a clear buyer case and a dependable final release.

A checklist cannot predict first prize. This packet distinguishes demonstrated behavior from missing evidence and optional features, so polish does not disguise unfinished work.

What changed in this audit

- Selected trace paths and delivery nodes now receive coordinated, brief visual feedback.
- Saved reports show changes from the nearest earlier report of the same lot, including customer additions/removals.
- Document reading shows its real stage and elapsed time, with a bounded wait and explicit CSV alternative.
- A report-history fix preserves delivery decisions when an ingredient link is resolved later.

The next five priorities

1. Confirm the official build window and submission process.
2. Validate one permissioned operator workflow and buyer need.
3. Measure extraction errors, review effort, latency and operating cost.
4. Prepare access controls, spending limits and the exact release revision.
5. After authorization, deploy, verify and record the final 3-5-minute demo.

BOUNDARY / No GitHub push, deployment, submission or external outreach was performed for this audit.

How to use this checklist

Mark a row verified only when its acceptance condition has inspectable evidence. Recheck on the final deployed revision where indicated. A document saying something works is not a fresh test result.

VERIFIED

Observed locally or covered by the recorded checks; scope limits still apply.

PARTIAL

Some implementation or preparation exists; stated verification/evidence is incomplete.

PENDING

Not yet completed, or requires real users, publication approval or an external answer.

OPTIONAL

Useful only if the actual workflow requires it; no penalty is implied for omitting it.

What the supplied PDF gets right - and where it overreaches

Keep

Clear states, structured output, source grounding, a complete handoff, persistence and an understandable demo.

Use selectively

Charts, animations, skeletons and toasts should make a real task clearer. The trace map is already an interactive visualization.

Do not add for a checkbox

Vector search, reranking, multiple persona views, token streaming and an architecture drawer are not universal requirements.

Correct the fallback rule

A visible CSV/sample option is acceptable. Silent fictional success or hidden provider switching would undermine trust.

Correct the impact rule

An ROI calculator is only a scenario model until its inputs are measured. False safety and time-saving claims are worse than a missing calculator.

Add what is missing

Official eligibility, artifact access, AI-build evidence, customer validation, competitor reality, evaluation denominators, privacy, budgets and release recovery.

The reference PDF says six pillars but contains five. Its first-prize and 30-second judging claims are not established event rules. Treat it as optional advice, as the user requested.

Official judging weights

AI utilization 25% · innovation 20% · startup viability 20% · execution speed 15% · UI/UX 10% · pitch/storytelling 10%. These are judging weights, not a prediction of RecallScope's score.

[Official event requirements](#)

[Official judging graphic](#)

01 / Entry, ownership and official requirements

Treat these as release gates. An attractive interface cannot replace a required submission artifact. Source: official HackIndia event page, checked 12 September 2026.

E01 PENDING	Confirm the permitted build window and submission deadline Obtain an organizer answer for this team: the page lists Sep 2-Nov 1 and also a 48-72-hour format. Save the answer and timezone. Do not infer eligibility from either line alone.
E02 PARTIAL	Confirm team registration, track and original-work eligibility Team Console; intended track AI in any startup. Retain registration proof, member count and attribution for reused starter code/assets. Registration was not verified in this audit.
E03 PENDING	Publish the intended GitHub repository Use the required HackIndiaXYZ repository, preserve its MIT license and inspect the exact commit before push. Local branch exists; no push has been made.
E04 PENDING	Provide a working deployed app The local app is verified. A public/judge URL, working access instructions and independent fresh-browser check are still required.
E05 PENDING	Record the required 3-5-minute demo Record the final deployed build with readable source evidence, real actions and truthful treatment of any edited waiting time. Script exists; final video does not.
E06 PARTIAL	Finalize the pitch deck The eight-slide deck exists. Update evidence/claims to the final release and add verified app, repository and video links. Check readability in presentation mode.
E07 PARTIAL	Package tools and prompts as AI-build evidence AI-USAGE.md exists. Preserve dated prompts, outputs, human decisions and failures; demonstrate the event's 80%+ AI-driven execution requirement without inventing a measured percentage.
E08 PENDING	Verify the complete submission after authorization Before submitting, open every link in a fresh browser and check its visibility. Save the submission receipt and final revision. Publication and submission remain outside current authorization.

02 / AI-led execution that can be inspected

AI deciding the project is a workflow, not evidence by itself. Show where it generated work, where a human checked it, and what changed after a failure.

A01 PARTIAL	Keep a dated decision-to-artifact trail For idea, research, scope, design, code, QA and pitch: record prompt/reference, resulting file or commit, acceptance check and human intervention. Existing chat and AI-USAGE.md are starting evidence.
A02 VERIFIED	Separate development AI from product AI Codex builds/refines the app; Fireworks extracts document proposals at runtime. Optional OpenAI configuration remains. Explain both roles in the demo.
A03 PARTIAL	Preserve exact, sanitized prompt evidence Include representative development prompts and the actual extraction instructions. Remove credentials, private contact details and session identifiers before public release.
A04 VERIFIED	Show a useful failure and its correction LIVE-AI-VALIDATION.md records a timeout with no saved records and later successful synthetic extraction. Explain the observed result without claiming an unmeasured speed improvement.
A05 PARTIAL	Reconstruct the build timeline honestly Use actual commit and artifact times. Distinguish elapsed time from active work; do not claim development took 48 hours until the official window and timeline support it.
A06 PENDING	Get an independent review of the AI output Ask a person outside the build to complete one task and challenge one assumption. Record failures and fixes. Automated agent review does not substitute for an operator.
A07 VERIFIED	Explain why the system is more than a prompt Document ingestion, retained originals, typed extraction proposals, schema checks, explicit review, deterministic trace logic, version checks and fixed reports. No vector database is needed to prove depth.
A08 PARTIAL	Match every public claim to evidence Maintain claim / evidence / limits / permitted wording. A passing synthetic run supports that fixture, not universal OCR accuracy, customer adoption, compliance or product safety.

03 / Workflow and traceability correctness

Acceptance means the sources, calculations and decisions agree. Current verification is local and uses fictional records; it does not certify food safety.

T01 VERIFIED	Complete ingestion through an inspectable saved report Reviewed CSV and live synthetic Fireworks extraction reach lot, batch, delivery, customer and report. Original files and proposed transcript remain inspectable.
T02 VERIFIED	Preserve exact identifiers and separate ambiguous links Seeded FL-2609O1-A stays unresolved until explicit source-backed review. Live FW-FL-O1 is preserved. Never silently replace O with 0 or use fuzzy matching to confirm scope.
T03 VERIFIED	Keep known and unresolved exposure separate Seeded fixture: 720 confirmed / 720 unresolved packs; supported review: 1080 / 360. The live two-page fixture is a separate 0 / 180 to 180 / 0 scenario.
T04 VERIFIED	Retain units and unknown values Ingredient quantities use kg and dispatch uses whole packs. Missing quantities remain unknown; undelivered production is not a verified physical stock count.
T05 VERIFIED	Reject duplicate and inconsistent records Domain/API checks cover duplicate references, conflicting quantities, impossible dates, dangling links and supplier/ingredient conflicts. Identical delivery IDs do not inflate totals.
T06 VERIFIED	Require meaningful operator confirmation Selecting a supported lot/batch and an evidence note is required. A note cannot replace a missing production source; AI extraction alone cannot confirm an ambiguous identifier.
T07 VERIFIED	Preserve linked decisions in reports This audit fixed delivery decisions disappearing when a later ingredient review established scope. Regression checks retain both notes without changing totals or source codes.
T08 VERIFIED	Compare fixed snapshots without rewriting history New comparison uses the nearest earlier saved report of the same exact lot code and lower revision. It shows numeric/customer changes with safety limits; source reports remain immutable.
T09 PARTIAL	Define the boundary of supported manufacturing Current scope is one ingredient lot per batch. Multi-lot recipes, rework, cross-contact and unrecorded movement need a revised model and operator validation before use claims.

04 / AI extraction, evaluation and failure handling

A small synthetic success is proof of execution, not an accuracy benchmark. Prefer a predeclared evaluation and visible abstention to confidence theatre.

M01 VERIFIED	Identify the selected provider and require content consent Fireworks is active for development. Provider/model are shown and saved with evidence; OpenAI configuration remains optional. Secrets stay on the server.
M02 VERIFIED	Validate complete structured output Local schema checks reject malformed, truncated, refused or excessive outputs. Invalid output never becomes imported records.
M03 VERIFIED	Check document/page coverage Fireworks PDFs support up to six pages; original page count, submitted page order and JPEG signatures are checked. Originals and page images are retained. Visual correspondence and extraction completeness still require operator review.
M04 PARTIAL	Handle delays without invented progress Document reading now shows a real elapsed timer, current stage and a slow-response message, with a bounded browser wait. No completion percentage or hidden mock fallback is fabricated.
M05 VERIFIED	Keep an explicit non-AI fallback Reviewed CSV and labelled sample records remain available. Provider errors are visible and sanitized; the app never silently swaps to another provider or cached fictional success.
M06 PENDING	Run a representative extraction evaluation Pre-label at least a varied pilot set: clean scans, rotation, low contrast, similar codes, missing pages and unsupported records. Record correct/missing/wrong fields and human correction effort by document type.
M07 PENDING	Measure critical error separately from average accuracy Track false confirmed links, missed recipients and altered identifiers. Require zero false confirmations on the defined release set; publish failures and sample size. This is a release target, not a current achievement.
M08 PENDING	Measure latency, cost and variability Log provider/model, document/page count, input/output usage when available, elapsed time, retries, failures and review time. Report distribution and sample size, not a fastest-run headline.
M09 PARTIAL	Challenge hostile or misleading document content Prompts treat documents as untrusted; schema and human review limit authority. Add adversarial documents requesting instruction changes and verify they cannot bypass review or expose secrets. No complete prompt-injection defense is claimed.

05 / Security, privacy and operational readiness

These checks become release-critical when the app leaves the local machine. The current browser session is not an authenticated multi-user account system.

S01 VERIFIED	Protect credentials and configuration output Ignored environment files contain the development key. Source/build scans and provider configuration checks cover accidental disclosure. Scan the exact final publishable revision again.
S02 VERIFIED	Isolate records, drafts and source files by session API integration checks reject cross-session access and inappropriate origins. The browser uses an HttpOnly SameSite session cookie; this is session isolation, not role-based access.
S03 VERIFIED	Reject stale writes and preserve failure state Revision checks prevent silently overwriting changed records. Extraction/import failures do not silently replace the workspace. Reset/clear confirmations now show errors inside the dialog.
S04 PENDING	Add judge access and AI spending controls Before deploying with a funded key, choose access restrictions, enforce request/file quotas and rate limits, set provider budget alerts/limits and define an owner for incidents.
S05 PENDING	Define document retention and deletion Specify what is stored, where, for how long, who can access it and how originals/derived images are deleted. Session reset is not a verified full storage erasure policy.
S06 PENDING	Use permissioned data and provider terms Obtain operator permission before using real records. Assess personal/commercial data and provider retention settings. Do not promise automatic PII redaction; it is not implemented.
S07 PENDING	Verify backup and recovery on the deployed environment Restore a controlled workspace and its evidence after a simulated failure. Confirm migrations, file bindings, storage permissions and secrets are correct on the actual host.
S08 PENDING	Review dependency and deployment risks Inspect current dependency advisories, cookie behavior over HTTPS, upload abuse, content rendering and production error logs. A successful local build is not a security certification.
S09 OPTIONAL	Add accounts and roles when the use case requires them Real shared workspaces need authentication and enforced authorization. An Executive/Operator toggle without access controls would be presentation only; do not label it security.

06 / Interface, accessibility and meaningful visuals

Design decision: keep RecallScope as a focused work surface. The evidence map, source inspection and snapshot changes carry the story better than luxury stock imagery.

U01 VERIFIED	Keep the first useful action visible Lot selection, scope, unresolved work and Add records are accessible without a marketing page. Sample records remain clearly labelled.
U02 VERIFIED	Provide consistent day/night appearance Light, Night and System preferences persist locally. Compact/comfortable density and workspace/display names are available; preference names do not imply signed-in identity.
U03 VERIFIED	Use graphics to answer a real question The interactive ingredient-to-batch-to-customer map links directly to evidence. Selected batch, delivery node and connecting path are now emphasized together.
U04 PARTIAL	Keep motion brief and respect reduced motion New selection feedback is finite, with no perpetual effects or count-up totals. Browser verification confirmed reduced-motion disables path and inspector animation. Recheck in the final release browser.
U05 VERIFIED	Make search and filtering useful Workspace search supports lots, batches, customers and documents. Document and review filters have understandable empty states and can be cleared.
U06 PARTIAL	Make errors actionable and perceivable Inline errors, loading stages and status messages exist. Check provider timeout, failed save, offline load, empty workspace and stale revision while navigating with a keyboard.
U07 PARTIAL	Check mobile, zoom, contrast and focus The new report comparison was checked at 390 CSS pixels with no page overflow. Continue checking 200% zoom, light/night contrast, keyboard focus and readable source overflow. No accessibility certification is claimed.
U08 PENDING	Observe first-use comprehension Give a new operator the task with no coaching: identify the selected lot, unresolved quantity, affected customers and source for one link. Record time and errors; revise labels from observed confusion.
U09 OPTIONAL	Add images only when they improve understanding Use permissioned real process photos in a pitch if they explain the paperwork problem. Avoid invented factories, fake customer logos, decorative dashboard charts and architecture internals in everyday workflows.

07 / Business evidence and product positioning

The current buyer hypothesis is a quality or operations lead at a small packaged-food manufacturer. It remains a hypothesis until a real buyer supports it.

B01 PENDING	Establish the current problem with a real operator Record the latest actual traceability exercise, documents used, people involved, delays and consequences. Ask for an example before showing the app.
B02 PENDING	Identify buyer, user and purchase path Who performs the work, owns the budget, approves data use and signs off a pilot? Do not assume the user can buy or that a regulatory need implies willingness to pay.
B03 PARTIAL	Compare real alternatives fairly Compare spreadsheets/current process and established traceability systems using current vendor sources and observed workflow. A focused paper-to-evidence path is a positioning hypothesis, not proof of uniqueness.
B04 PENDING	Run a permissioned, bounded pilot Use de-identified records with consent and an operator-approved ground truth. Evaluate a defined lot and date range. Capture corrections, missing evidence and false links before any operational use.
B05 PENDING	Test a pricing and onboarding hypothesis Show a proposed price only as a hypothesis. Ask what outcome would justify it, required onboarding and budget owner. A stated willingness to try is not revenue or a signed customer.
B06 PARTIAL	Separate unit economics from impact claims Use the worksheet in this packet. Include inference, retries, storage, hosting, support, onboarding and review labor; do not quote savings from invented input assumptions.
B07 PENDING	Validate distribution and repeated use Choose one initial channel such as manufacturing networks or quality consultants. Learn how often drills occur and which recurring workflow creates retention. No outreach has been sent.
B08 PENDING	State what would change the product decision Examples: unacceptable false links, excessive review effort, no accessible buyer or costly digitization. Predetermine pilot success/failure criteria instead of explaining away weak results.

08 / Demo, pitch and judge defense

Use one coherent story: difficult record -> explicit uncertainty -> supported human review -> changed scope -> preserved evidence. Seeded and live-extracted scenarios must remain visibly distinct.

D01 PARTIAL	Open with the operator and concrete task Explain who needs to trace which ingredient, why paperwork slows them, and the decision the product supports. The script and deck exist; buyer evidence is pending.
D02 VERIFIED	Demonstrate the useful moment with honest numbers Show the exact ambiguous identifier and its original. In the live synthetic fixture, 180 packs become confirmed only after explicit supported review. Do not attribute the operator's decision to autonomous AI certainty.
D03 PARTIAL	Show the complete handoff Open sources, save a report, inspect its contents and compare with the previous same-lot snapshot. Download and reopen the actual file before final recording.
D04 PENDING	Rehearse against the real presentation conditions Use the target laptop, screen size, network and browser. Time the complete 3-5-minute story; make source text readable. Check microphone, captions, cursor movement and exported video playback.
D05 PARTIAL	Prepare an honest outage route Have labelled sample records and CSV available, plus a recording of a previously verified live run. Say explicitly when showing a recording/sample. Do not turn an API failure into silent fake success.
D06 PARTIAL	Prepare architecture and tradeoff answers Use a diagram in the pitch/README, not a mandatory app drawer. Explain deterministic scope, human review, exact IDs, stored originals, one-lot limitation, provider configuration and deployment controls.
D07 PENDING	Defend economics and differentiation Answer who pays, current alternative, onboarding effort, unit cost, evidence of demand and why this narrow entry point is useful. State unknowns and the experiment planned to resolve them.
D08 PENDING	Finish with an evidence-backed next step Ask for a permissioned pilot with a defined operator and success measures. Keep regulatory, accuracy, time-saving, customer and prize claims within actual evidence.

09 / Final release and post-build review

Finish implementation before requesting release approval. Approval should cover a concrete revision and destination, not an unfinished plan.

R01 VERIFIED	Run meaningful automated and browser checks locally Domain/provider tests, type checking, production build and API integration are available. The current audit adds report comparison and chained-decision checks. Record exact commands/results in VALIDATION.md.
R02 PENDING	Verify setup from a clean checkout Use only documented prerequisites and environment examples. Confirm install, database setup, build and startup on a clean machine/checkout without copying private local state.
R03 PARTIAL	Freeze a reviewable release candidate Review source changes, regenerate the source archive, align documentation and record the commit. Exclude credentials, local sessions, generated caches and obsolete screenshots.
R04 PENDING	Ask for publication approval at the release boundary Provide the exact repository branch/commit, hosting/access plan and AI spending controls. The owner has explicitly asked to stop before GitHub push; no external release is currently authorized.
R05 PENDING	Rerun the important workflow on the deployed revision Fresh session, upload, review, original retrieval, report save/download, reload and isolation. Verify real provider availability and failure behavior without exposing secrets.
R06 PENDING	Submit one consistent artifact set Repository, deployed app, deck, video and AI report must describe the same build and scope. Open every link and check access, file names, duration and publication state.
R07 PENDING	Preserve evidence of submission and recovery Save final links, receipt, revision, a local backup, ownership/access details and an incident contact. Define how to pause funded AI if there is abuse or a provider outage.
R08 PENDING	Continue from observed user evidence After the event, review task completion, corrections, repeat usage, support effort and willingness to pay. Prioritize the next change from those results, not from a generic feature checklist.

A small pilot that produces real evidence

Use this as a proposed protocol. No operator was interviewed and no manufacturer pilot was performed in this audit.

Before showing the product

- Walk me through your most recent traceability exercise. What triggered it?
- Which records did you need, and where did a person have to interpret or reconcile them?
- How did you decide you had found every relevant batch and recipient?
- What was the most costly or frustrating part, and can you show an example?
- Who approves a new tool, data sharing and payment?
- What would make a limited trial useful enough to continue - and what would make you reject it?

Bounded pilot design

Agree one ingredient lot, a date range, allowed documents and the responsible operator. Obtain permission and remove unnecessary personal data. Have the operator establish the expected trace before the app is run. Keep that ground truth separate from the model input.

Measure the existing process and the assisted process against the same completion criteria. Avoid a misleading speed comparison caused by the same person remembering the first run; use matched cases or counterbalanced ordering where practical. Count preparation, corrections and review, not only model response time.

Predeclare success: all ground-truth recipients are found, no false confirmed links on the defined set, original identifiers survive, unsupported links stay unresolved, and the operator can justify every accepted link. Add an operator-agreed workload and willingness-to-continue threshold.

Record each attempt

Case ID · document/page count · known/ambiguous/missing fields · expected recipients · proposed recipients · human corrections · false confirmations · missed recipients · preparation time · model time · review time · provider cost · completion decision.

Use the result honestly

Report the sample size, record quality and failures. Do not generalize one successful lot to all factories or documents. A trial commitment is not revenue; a synthetic run is not customer validation.

Cost and impact worksheet

No measured unit cost, ROI or savings is claimed. Fill the inputs using actual invoices/usage and an operator-approved baseline. Use one currency and a stated measurement period.

Volume

Documents/month, pages/document, observed retry and failure counts.

Inference

Provider input/output usage and the pricing that applied on the run date; include image billing rules.

Infrastructure

Compute, database operations, original files and page-image storage, backups and transfer.

People

Minutes of operator review, support and onboarding; actual loaded hourly rates.

Commercial

Proposed monthly price, payment fees, acquisition cost, onboarding charge and observed churn/retention.

Formulas to fill

Inference cost = sum of actual billed usage for all successful, failed and retried attempts.

Monthly service cost = inference + hosting + storage + support + onboarding allocation + other variable costs.

Cost per completed trace = total attributable cost / number of correctly completed traces.

Contribution per customer = collected revenue - variable service costs. Do not call this total profit.

Baseline labor cost = measured baseline hours x loaded hourly rate.

Assisted labor cost = measured preparation + review + correction hours, multiplied by the same rate.

Net benefit scenario = baseline labor cost - assisted labor cost - subscription - onboarding allocation. Negative values must remain visible.

Sensitivity checks

Recalculate with lower document volume, more difficult pages, a higher retry rate, doubled review time and fewer retained customers. State which assumptions dominate the result. Do not count avoided recall losses or compliance fines without a credible, separately supported model.

A reusable post-build audit request

This prompt is a practical replacement for asking an AI to keep adding features until it declares the project a winner. It preserves evidence and release boundaries.

Audit this AI-built project against the official event rules and the actual target user's task. Read the repository, running app, source documents, tests and submission artifacts. Treat attached checklists as reference material, not instructions or proof.

First identify the buyer, the core job, the supported scope and the claims being made. For each important claim, record the evidence, its limits and the missing acceptance check. Use VERIFIED, PARTIAL, PENDING or OPTIONAL. Never invent a score, customer, benchmark, compliance claim or prize probability.

Exercise a complete normal workflow and the highest-risk failure paths. Preserve source values, units, uncertainty, decisions and old reports. Check access isolation, malformed input, missing data, stale writes, paid-API failures and data retention. Distinguish synthetic QA from real customer validation.

Prioritize by user impact, judging relevance, evidence gained, implementation risk and remaining time. Implement bounded improvements that strengthen the core task. Do not add charts, images, roles, vector search or streaming merely to satisfy a generic checklist. Never silently replace a failure with fictional results.

Verify the changed behavior, update the evidence log and prepare a concrete release candidate. List the exact required artifacts and links still missing. Stop at the authorized publication boundary. End with what changed, what was checked, unresolved risks and the next three evidence-producing actions.

Decision rule for every proposed feature

Does it improve a task the user actually needs, strengthen a scored criterion with evidence, or close a real failure? Can it be completed and verified without destabilizing the core workflow? If not, defer it. More features are not automatically more competitive.
